Revision History

Version No.	Version Details	Date
1.0	Final	8/11/2024

1.0 INTRODUCTION

This report has been compiled to provide a monthly summary of environmental monitoring results for Mount Thorley Warkworth (MTW). This report includes all monitoring data collected for the period 1 June to 30 June 2024.

2.0 AIR QUALITY

2.1 Meteorological Monitoring

Meteorological data is collected at MTW’s ‘Charlton Ridge’ meteorological station (refer to **Figure 3**).

2.1.1 Rainfall

Rainfall for the reporting period is summarised in **Table 1**. The year-to-date monthly rainfall totals, 2024 monthly rainfall totals and historical average monthly rainfall trend are shown in **Figure 1**.

Table 1: Monthly Rainfall MTW

2024	Monthly Rainfall (mm)	Cumulative Rainfall (mm)
June	53.8	392.8

Figure 1: Rainfall Trend YTD

Note: The historical average monthly rainfall is calculated from 2007 to 2023 monthly totals

2.1.2 Wind Speed and Direction

Winds from the Northwest were dominant during the reporting period as shown in **Figure 2**.

Figure 2: Charlton Ridge Wind Rose – June 2024

Figure 3: Air Quality Monitoring Locations

2.2 Depositional Dust

To monitor air quality, MTW operates and maintains a network of seven depositional dust gauges, situated on private and mine owned land surrounding MTW.

During the reporting period the Warkworth monitor recorded a monthly result above the long-term impact assessment criteria of 4.0 g/m² per month. Field notes associated with Warkworth confirm the presence of sandy sediment, insects, and decomposing vegetation. As such the result (39.3 g/m²) is considered contaminated and will be excluded from calculation of the annual average.

Figure 4 displays insoluble solids results from depositional dust gauges during the reporting period compared against the year-to-date average and the annual impact assessment criteria.

An annual assessment of MTW's compliance with the Long-Term Impact Assessment Criteria will be provided in the 2024 Annual Review Report.

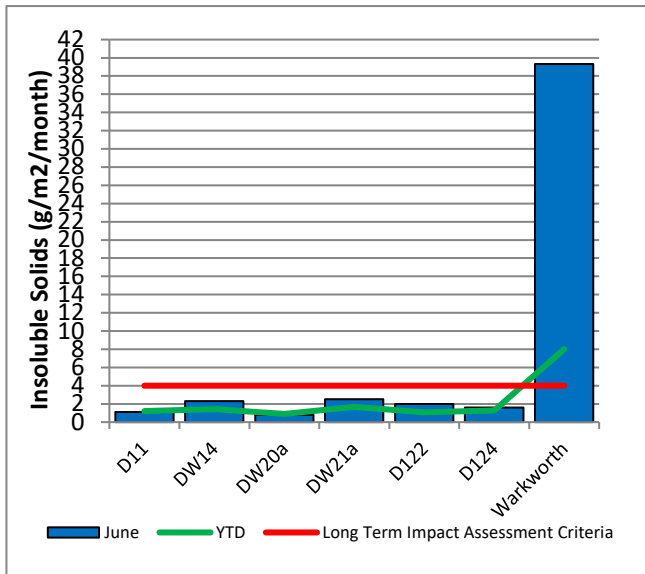

Figure 4: Depositional Dust – June 2024

2.3 Suspended Particulates

Suspended particulates are measured by a network of High Volume Air Samplers (HVAS) measuring Total Suspended Particulates (TSP) and Particulate Matter <10µm (PM₁₀). The location of these monitors can be found in **Figure 3**. Each HVAS was run for 24 hours on a six-day cycle in accordance with EPA requirements.

2.3.1 HVAS PM₁₀ Results

Figure 5 shows the individual PM₁₀ results at each monitoring station against the short-term impact assessment criteria of 50µg/m³.

There were no exceedances of the short term (24hr) PM₁₀ impact assessment criteria during June 2024

Figure 6 shows the annual average PM₁₀ result against the long-term impact assessment criteria.

An assessment of MTW's compliance with the Long-Term Impact Assessment Criteria will be provided in the 2024 Annual Review Report.

Figure 5: Individual PM₁₀ Results – June 2024

Figure 6: Annual Average PM₁₀ – June 2024

2.3.2 TSP Results

Figure 7 shows the annual average TSP results compared against the long-term impact assessment criteria of 90µg/m³.

An assessment of MTW’s compliance with the Long-Term Impact Assessment Criteria will be provided in the 2024 Annual Review Report.

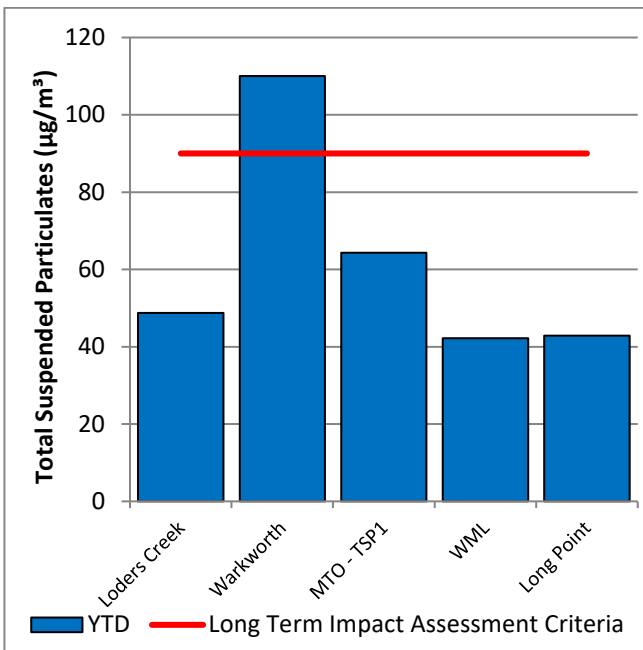

Figure 7: Annual Average Total Suspended Particulates – June 2024

2.3.3 Real Time PM₁₀ Results

MTW maintains a network of real time PM₁₀ monitors. The real time air quality monitoring stations continuously log information and transmit data to a central database, generating internal alerts when particulate matter levels exceed internal trigger limits.

Results for real time dust sampling are shown in Figure 8, including the daily 24-hour average PM₁₀ result and the annual PM₁₀ average.

On 29 June 2024, the Warkworth TEOM (51.3 µg/m³) exceeded the short term (24hr) criteria. The measurement was assessed for MTW’s potential contribution based on meteorological conditions on the day resulting in a maximum estimated contribution of 2.7 µg/m³, less than a 6% contribution to the result. Accordingly, no further action is required (as per the approved Air Quality Monitoring Programme).

Data was not available on 1, 2, 3 and 26 June 2024 from the Wambo TEOM due to equipment issues.

2.3.4 Real Time Alarms for Air Quality

During June, the real time monitoring system generated 126 automated air quality related alerts, including 7 alerts for adverse meteorological conditions and 119 alerts for elevated PM₁₀ levels.

Figure 8: Real Time PM₁₀ daily 24hr average (line graphs) and YTD annual average (column graphs) – June 2024

3.0 WATER QUALITY

MTW maintains a network of surface water and groundwater monitoring sites.

3.1 Surface Water

Monitoring is conducted at mine site dams and surrounding natural watercourses. The surface water monitoring locations are outlined in **Figure 15**.

Surface water courses are sampled on a monthly or quarterly sampling regime. Water quality is evaluated through the parameters of pH, Electrical Conductivity (EC) and Total Suspended Solids (TSS). The Hunter River and the Wollombi Brook are sampled both upstream and downstream of mining operations, to record background water quality and to monitor the potential impact of mining on the river system. Other Hunter River tributaries are also monitored.

3.1.1 Surface Water Monitoring results

Figure 9 to Figure 11 show the long-term surface waste trend (2021 – current) within MTW mine dams. **Figure 12 to Figure 14** show the long-term surface water trend (2021 – current) in surrounding watercourses.

Figure 9: Site Dams Electrical Conductivity Field Trend – June 2024

Figure 12: Watercourse pH Field Trend – June 2024

Figure 13: Watercourse Electrical Conductivity Field Trend – June 2024

Figure 14: Watercourse Total Suspended Solids Trend – June 2024

3.1.2 Surface Water Trigger Tracking

Internal trigger limits have been developed to assess monitoring data on an on-going basis, and to highlight potentially adverse surface water impacts. The process for evaluating monitoring results against the internal triggers and subsequent responses are outlined in the MTW Water Management Plan.

Current internal surface water trigger limit breaches are summarised in **Table 2**.

Table 2: Surface Water Trigger Tracking – June 2024

Site	Date	Trigger Limit Breached	Action Taken in Response
W5	13/02/2024 21/03/2024	TSS – 50mg/L (ANZECC criteria)	Unlikely to be associated with MTW mining related impacts. Elevated TSS results most likely attributable to sampling from water with no flow (pool of water). Note: Result is not considered to be a valid representation given that there was no flow at the time of sampling. Additionally, TSS returned to within trigger level for subsequent sampling on 24/04/2024, 7/05/2024, and 24/06/2024. No follow up required.
WW5	21/03/2024	TSS – 50mg/L (ANZECC criteria)	Watching Brief* Elevated TSS associated with high runoff due to rain event (24.4mm between 17/03/2024 – 20/03/2024), resulting in mobilisation of sediment. TSS returned to within trigger level for subsequent sampling round on 24/06/2024. No follow up required.
W4	05/04/2024	TSS – 50mg/L (ANZECC Criteria)	Elevated TSS considered associated with runoff due to rainfall event, resulting in mobilisation of sediment. No MTW site sources of sediment identified. TSS returned to within trigger level for subsequent sampling round on 7/05/2024. No follow up required.
W14	07/05/2024	TSS – 50mg/L (ANZECC criteria)	Watching Brief* Elevated TSS considered associated with runoff due to rainfall event, resulting in mobilisation of sediment. No MTW site sources of sediment identified. No follow up required.
W15	07/05/2024	TSS – 50mg/L (ANZECC criteria)	Watching Brief* Elevated TSS considered associated with runoff due to rainfall event, resulting in mobilisation of sediment. No MTW site sources of sediment identified. No follow up required.
W27	07/05/2024	TSS – 50mg/L (ANZECC criteria)	Watching Brief*. Unlikely to be associated with MTW mining related impacts. Elevated TSS results most likely attributable to sampling from water with no flow (pool of water).
WW5	24/06/2024	EC – 95 th Percentile	Watching Brief*

* = Watching brief established pending outcomes of subsequent monitoring events. No specific actions required.

3.2 HRSTS Discharge

MTW participates in the Hunter River Salinity Trading Scheme (HRSTS), allowing discharge from licensed discharge points located at Dam 1N and Dam 9S. Discharges can only take place subject to HRSTS regulations.

During the reporting period 121.69 ML of water was discharged from Dam 9S.

Figure 15: Surface Water Monitoring Location Plan

3.3 Groundwater Monitoring

Groundwater monitoring is undertaken on a quarterly basis in accordance with the MTW Groundwater Monitoring Programme.

Figure 16 to Figure 64 show the long-term water quality trends (2021 - current) for groundwater bores monitored at MTW.

3.3.1 Groundwater Trigger Tracking

Internal trigger limits have been developed to assess monitoring data on an on-going basis, and to highlight potentially adverse groundwater impacts. The process for evaluating monitoring results against the internal triggers and subsequent responses are outlined in the MTW Water Management Plan. Locations of groundwater bores are shown in **Figure 56**.

Current internal groundwater trigger limit breaches are summarised in **Table 3**

Table 3: Groundwater Trigger Tracking – June 2024

Site	Date	Trigger Limit Breached	Action Taken in Response
OH787	26/03/2024	EC – 95 th Percentile	Watching brief*
OH788	26/03/2024	EC – 95 th Percentile	Watching Brief*
OH1138(1)	10/04/2024	EC – 95 th Percentile	EC was above the 95 th percentile for one sample event on 10/04/2024, but returned to below 95 th percentile for subsequent monitoring on 16/05/2024, and 20/06/2024. No further action required.
PZ7S	29/02/2024 27/05/2024	pH – 5 th Percentile	Consultant to be engaged to undertake investigation
OH1126	19/03/2024 20/06/2024	pH – 5 th Percentile	Consultant to be engaged to undertake investigation

Site	Date	Trigger Limit Breached	Action Taken in Response
MB15MTW01D	07/02/2024 21/05/2024	pH – 5 th Percentile	<p>Investigation previously completed. The consultant identified in their report that “it is likely the trigger values derived for shallow overburden bores do not accurately represent in-situ groundwater water quality for MB15MTW01D”.</p> <p>MB15MTW01D is part of a larger dataset from the shallow overburden seam. The 5th percentile of the seam is currently 6.3 while the 5th percentile of MB15MTW01D is 5.5. The result is consistent with previous results for this bore since 2021 and within sample location trigger levels.</p> <p>No further investigation required.</p>
WOH2156B	15/02/2024 28/05/2024	pH – 5 th Percentile	Watching Brief*
PZ9S	20/06/2024	pH – 95 th Percentile	Watching Brief*
* = Watching brief established pending outcomes of subsequent monitoring events. No specific actions required.			

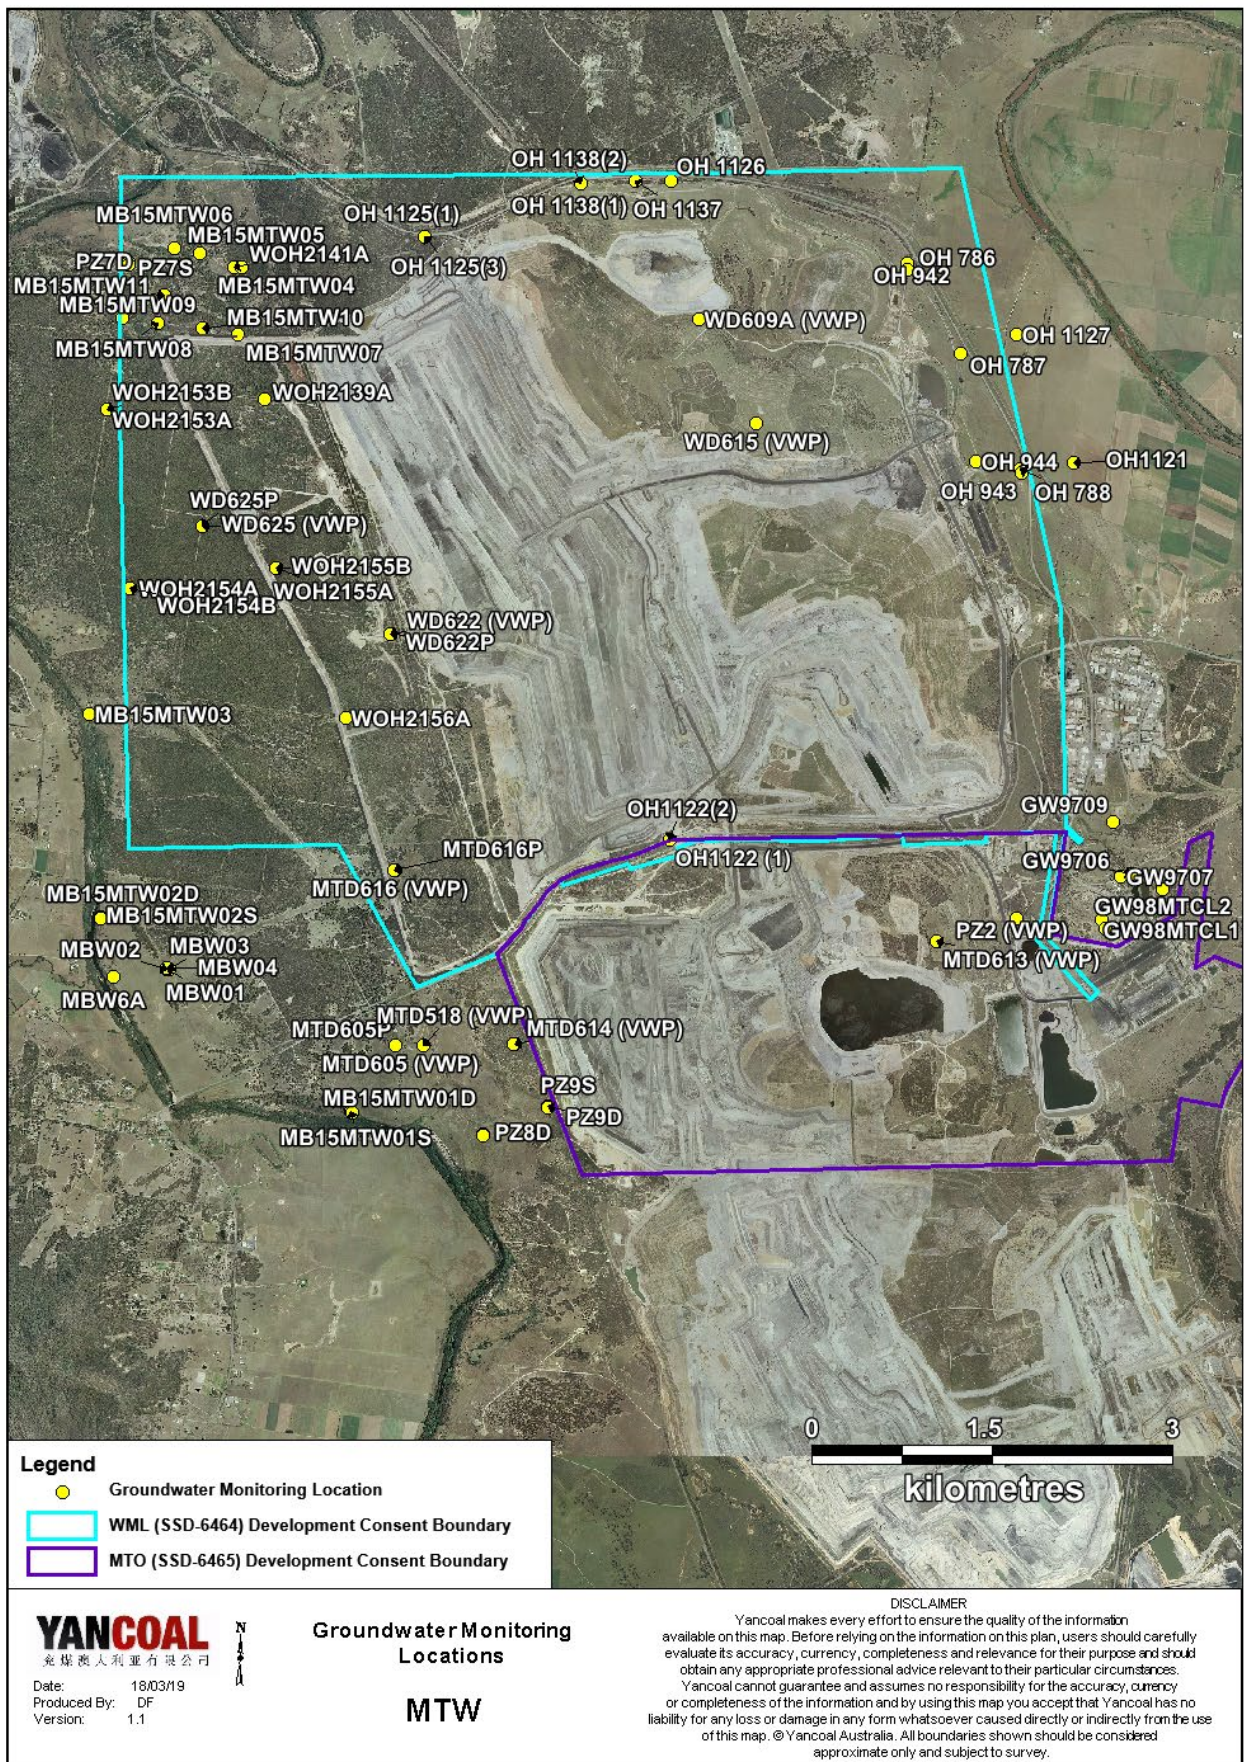

Figure 65: Groundwater Monitoring Location Plan

4.0 BLAST MONITORING

MTW have a network of six blast monitoring units. These are located at nearby privately owned residences and function as regulatory compliance monitors.

The location of these monitors can be found in **Figure 72**.

4.1 Blast Monitoring Results

During June 2024, 17 blasts were initiated at MTW. **Figure 9** to **Figure 14** show the blast monitoring results for the reporting period against the impact assessment criteria. The criteria are summarised in **Table 4**.

Table 4: Blasting Limits

Airblast Overpressure (dB(L))	Comments
115	5% of the total number of blasts in a 12 month period at WML or MTO
120	0%
Ground Vibration (mm/s)	Comments
5	5% of the total number of blasts in a 12 month period at WML or MTO
10	0%

During the reporting period 1 blast exceeded the 120dB(L) threshold for airblast overpressure, at the Abbey Green (120.55dB) and MTIE (122.67dB) monitoring locations. This incident was reported to the Department of Planning, Housing and Infrastructure (DPHI) and Environment Protection Authority (EPA), and further details are provided in **Section 8**. No blasts exceeded the 5mm/s criteria for ground vibration.

Figure 68: MTIE Blast Monitoring Results – June 2024

Figure 70: Warkworth Blast Monitoring Results – June 2024

Figure 69: Wambo Road Blast Monitoring Results – June 2024

Figure 71: Wollemi Peak Road Blast Monitoring Results – June 2024

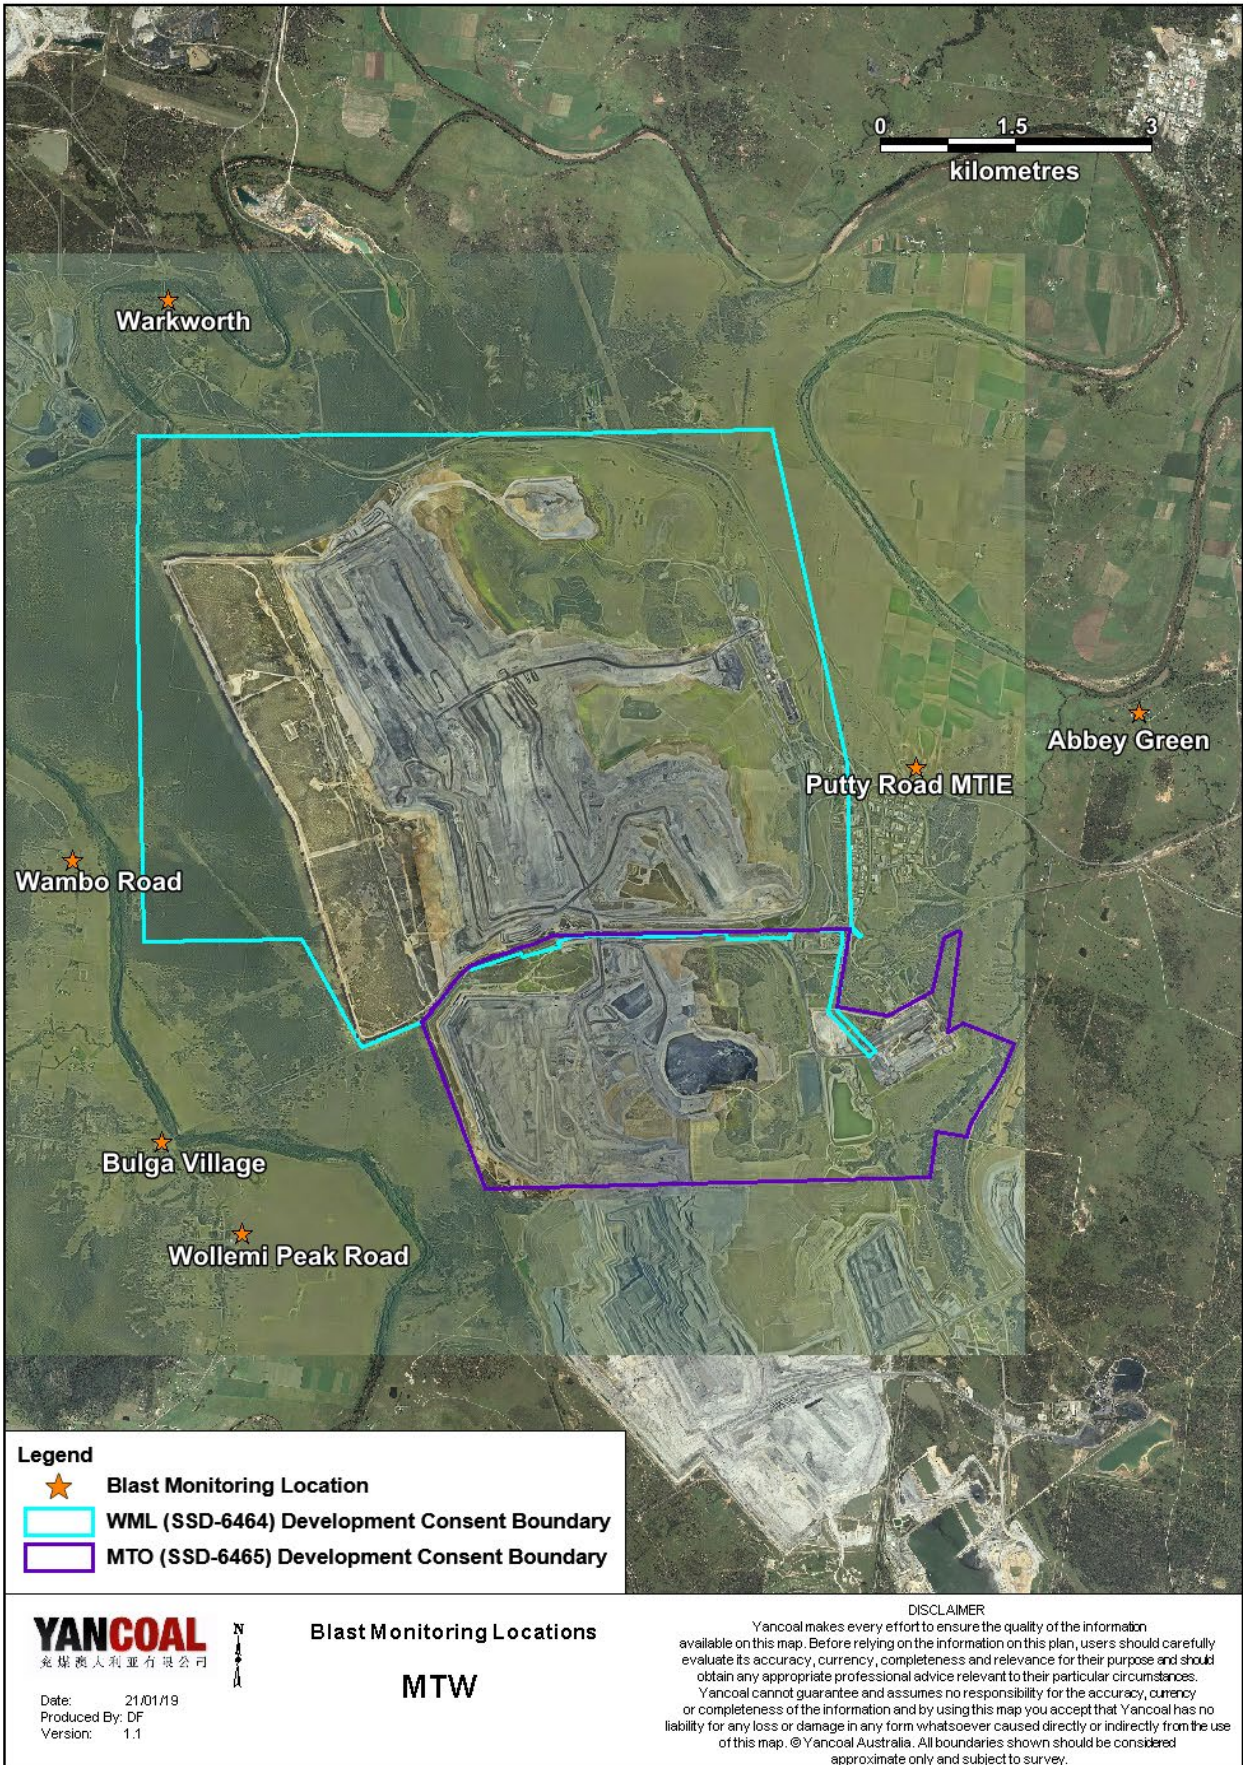

Figure 72: MTW Blast Monitoring Location Plan

5.0 NOISE

Routine attended noise monitoring is carried out in accordance with the MTW Noise Management Plan. A review against EIS predictions will be reported in the Annual Review. The purpose of the noise surveys is to quantify and describe the acoustic environment around the site and compare results with specified limits. Real time noise monitoring also occurs at five sites surrounding MTW. Noise monitoring locations are displayed in **Figure 73**.

5.1 Attended Noise Monitoring Results

Attended monitoring was conducted at receiver locations surrounding MTW on the night of 4 June 2024. All measurements complied with the relevant criteria. Results are detailed in **Table 5 to Table 8**.

5.1.1 WML Noise Assessment

Compliance assessments undertaken against the WML noise criteria are presented in **Tables 5 and 6**.

Table 5: L_{Aeq}, 15 minute Warkworth Impact Assessment Criteria – June 2024

Location	Date and Time	Wind Speed (m/s)	Stability Class	Criterion dB(A)	Criterion Applies? ¹	WML L _{Aeq} dB ^{2,3,4}	Exceedance ^{3,4}
Bulga RFS	4/06/2024 22:48	0.3	F	37	Yes	33	Nil
Bulga Village	4/06/2024 22:07	2.2	F	38	No	<25	N/A
Gouldsville	4/06/2024 21:26	1.8	E	38	Yes	33	Nil
Inlet Road	4/06/2024 21:21	1.6	F	37	Yes	28	Nil
Inlet Road West	4/06/2024 21:00	2.8	D	35	Yes	<20	Nil
Long Point	4/06/2024 21:00	2.8	D	35	Yes	<20	Nil
South Bulga	4/06/2024 23:36	1.8	E	35	Yes	IA	Nil
Wambo Road	4/06/2024 21:46	2.5	D	38	Yes	IA	Nil

Notes:

1. Noise criteria apply during all meteorological conditions except the following: wind speeds greater than 3 m/s measured at 10 metres above ground level; stability category F temperature inversion conditions and wind speeds greater than 2m/s at 10m above ground level; or stability category G temperature inversion conditions. Criterion may or may not apply due to rounding of meteorological data values;

2. Site-only L_{Aeq},15minute attributed to WML, including modifying factors if applicable;

3. Bold results in red indicate exceedance of relevant criterion; and

4. NA in exceedance column means atmospheric conditions outside conditions specified in consent, therefore criterion was not applicable.

Table 6: L_{A1}, 1 minute Warkworth - Impact Assessment Criteria – June 2024

Location	Date and Time	Wind Speed (m/s)	Stability Class	Criterion dB(A)	Criterion Applies? ¹	WML L _{A1} , 1min dB ^{2,3,4}	Exceedance ^{3,4}

Wambo Road	4/06/2024 21:46	2.5	D	48	Yes	IA	Nil

Notes:

1. Noise criteria apply during all meteorological conditions except the following: wind speeds greater than 3 m/s measured at 10 metres above ground level; stability category F temperature inversion conditions and wind speeds greater than 2m/s at 10m above ground level; or stability category G temperature inversion conditions. Criterion may or may not apply due to rounding of meteorological data values;

2. Site-only L_{A1},1minute attributed to WML;

3. Bold results in red indicate exceedance of relevant criterion; and

4. NA in exceedance column means atmospheric conditions outside conditions specified in consent, therefore criterion was not applicable.

5.1.2 MTO Noise Assessment

Compliance assessments undertaken against the MTO noise criteria are presented in **Table 7** and **8**.

Table 7: L_{Aeq, 15minute} Mount Thorley - Impact Assessment Criteria – June 2024

Location	Date and Time	Wind Speed (m/s)	Stability Class	Criterion dB	Criterion Applies? ¹	MTO L _{Aeq} dB ^{2,3,4}	Exceedance ^{3,4}
Bulga RFS	4/06/2024 22:48	0.3	F	37	Yes	31	Nil
Bulga Village	4/06/2024 22:07	2.2	F	38	No	<30	N/A

Inlet Road	4/06/2024 21:21	1.6	F	37	Yes	IA	Nil
Inlet Road West	4/06/2024 21:00	2.8	D	35	Yes	IA	Nil
Long Point	4/06/2024 21:00	2.8	D	35	Yes	28	Nil
South Bulga	4/06/2024 23:36	1.8	E	35	Yes	<20	Nil
Wambo Road	4/06/2024 21:46	2.5	D	38	Yes	31	Nil

Notes:

1. Noise criteria apply during all meteorological conditions except the following: wind speeds greater than 3 m/s measured at 10 metres above ground level; stability category F temperature inversion conditions and wind speeds greater than 2m/s at 10m above ground level; or stability category G temperature inversion conditions. Criterion may or may not apply due to rounding of meteorological data values;

2. Site-only L_{Aeq, 15minute} attributed to MTO, including modifying factors if applicable;

3. Bold results in red indicate exceedance of relevant criterion; and

4. NA in exceedance column means atmospheric conditions outside conditions specified in consent, therefore criterion was not applicable.

Table 8: L_{A1, 1Minute} Mount Thorley - Impact Assessment Criteria – June 2024

Location	Date and Time	Wind Speed (m/s)	Stability Class	Criterion dB	Criterion Applies? ¹	MTO L _{A1, 1min} dB ^{2,3,4}	Exceedance ^{3,4}
Bulga RFS	4/06/2024 22:48	0.3	F	47	Yes	35	Nil
Bulga Village	4/06/2024 22:07	2.2	F	48	No	<30	N/A
Gouldsville	4/06/2024 21:26	1.8	E	45	Yes	IA	Nil
Inlet Road	4/06/2024 21:21	1.6	F	47	Yes	IA	Nil
Inlet Road West	4/06/2024 21:00	2.8	D	45	Yes	IA	Nil
Long Point	4/06/2024 21:00	2.8	D	45	Yes	35	Nil
South Bulga	4/06/2024 23:36	1.8	E	46	Yes	<20	Nil
Wambo Road	4/06/2024 21:46	2.5	D	48	Yes	38	Nil

Notes:

1. Noise criteria apply during all meteorological conditions except the following: wind speeds greater than 3 m/s measured at 10 metres above ground level; stability category F temperature inversion conditions and wind speeds greater than 2m/s at 10m above ground level; or stability category G temperature inversion conditions. Criterion may or may not apply due to rounding of meteorological data values;

2. Site-only L_{A1, 1minute} attributed to MTO;

3. Bold results in red indicate exceedance of relevant criterion; and

4. NA in exceedance column means atmospheric conditions outside conditions specified in consent, therefore criterion was not applicable.

5.1.3 NPfl Low Frequency Assessment

In accordance with the requirements of the EPA’s Noise Policy for Industry (NPfl), the applicability of the low frequency modification factor corrections has been assessed. There were no noise measurements taken during the reporting period which required the penalty to be applied. The WML assessment for low frequency noise is shown in **Table 9** and the MTO assessment for low frequency noise is shown in **Table 10**.

Table 9: Warkworth Low Frequency Noise Assessment – June 2024

Location	Date and Time	Measured WML LAeq dB	Criterion Applies?	Intermittency Modifying Factor?	Tonality Modifying Factor?	Frequency of Tonality ¹	Low-frequency Modifying Factor?	Maximum Exceedance of Reference Spectrum ^{1,2}	Penalty dB ²
Bulga RFS	4/06/2024 22:48	33	Yes	No	No	N/A	No	N/A	Nil

Notes:

1. NA denotes 'not applicable'; and

2. Bold results indicate that application of NPfI modifying factor/s is required.

Figure 73: Noise Monitoring Location Plan

5.2 Noise Management Measures

A program of targeted supplementary attended noise monitoring is in place at MTW, supported by the real-time directional monitoring network and ensuring the highest level of noise management is maintained. The supplementary program is undertaken by MTW personnel and involves:

- Routine inspections from both inside and outside the mine boundary;
- Routine and as-required handheld noise assessments (undertaken in response to noise alarm and/or community complaint), comparing measured levels against consent noise limits; and
- Validation monitoring following operational modifications to assess the adequacy of the modifications.

Where a noise assessment identifies noise emissions which are exceeding the relevant noise limit(s) for any particular residence, modifications will be made to ensure that the noise event is resolved within 75 minutes of identification. The actions taken are commensurate with the nature and severity of the noise event, but can include:

- Changing the haul route to a less noise sensitive haul;
- Changing dump locations (in-pit or less exposed dump option);
- Reducing equipment numbers;
- Shut down of task; or
- Site shut down.

A summary of these assessments undertaken are provided in **Table 11**.

Table 11: Supplementary Attended Noise Monitoring Data – June 2024

No. of assessments	No. of assessments > trigger	No. of nights where assessments > trigger	% greater than trigger
671	11	5	1.6

Note: Measurements are taken under all meteorological conditions, including conditions under which the consent noise criteria do not apply.

6.0 OPERATIONAL DOWNTIME

During June, a total of 224.9 hours of equipment downtime was logged in response to environmental events such as dust, noise and adverse meteorological conditions. Operational downtime by equipment type is shown in **Figure 74**.

Figure 74: Operational Downtime by Equipment Type – June 2024

7.0 REHABILITATION

During June 2024, 14.2 Ha of land was released, 9.6 Ha was bulk shaped, 4.4 Ha was composted, 7.3 Ha was topsoiled and 10.2 Ha was rehabilitated.

Figure 75: Rehabilitation YTD – June 2024

8.0 ENVIRONMENTAL INCIDENTS

There was one environmental incident during the reporting period.

An exceedance of the WML airblast overpressure was recorded at two monitoring stations on 20 June 2024 at 11:42 AM. Monitoring results from blast event n45-gmb-pr4 indicated an airblast overpressure of 122.7 dB at the Putty – MTIE monitoring station, which is 2.7 dB above the airblast overpressure criterion. For the same blast, the airblast overpressure was measured to be 120.6 dB at the Abbey Green monitoring station, which is 0.6 dB above the relevant criteria. WML undertook an investigation of relevant factors affecting airblast overpressure, and the investigation determined that the airblast overpressure was predicated to be within compliance limits at all monitoring locations prior to firing; the effects of meteorological conditions were considered during the blast planning process and did not indicate predicted enhancement at the blast monitoring locations. Regression analysis identified that meteorology was unlikely to have an influence on the resulting airblast levels, however there is potential that wavefront reinforcement and the arrival time of airblast energy from each blast hole could have contributed to increased overpressure. There was no excessive signs of face burst, but there was some evidence of stemming ejections from the observations of the blast. It is noted that no community complaints were received in relation to the blast event, and all other blast monitoring locations indicated airblast overpressure levels below 115 dB.

WML's investigation used third party experts to identify the cause of the overpressure levels with the intent of preventing recurrence. The investigation determined that wavefront reinforcement of airblast overpressure caused the peak overpressure recordings at the Putty Road – MTIE and Abbey Green monitoring locations. The investigation indicated the potential for wave reinforcement of airblast overpressure had not been fully considered in the blast design process and actions have been taken to ensure the risk of wavefront reinforcement is appropriately considered in the blast design process for future blasts.

The NSW Environment Protection Authority and the Department of Planning, Housing and Infrastructure

was notified of a potential airblast overpressure exceedance on 20 June 2024. Written reports were provided to the EPA and the DPHI on 27 June 2024. Further information was provided to DPHI on 9 August 2024, and DPHI issued an official Warning Letter. The private residences within the monitoring area were notified of the airblast overpressure exceedance.

9.0 COMPLAINTS

Six complaints were received during the reporting period. Details of these complaints are shown in **Table 12**.

Table 12: Complaints Summary YTD
